AI21BTECH11003

Question: If A,B,C are three events associated with a random experiment,prove that

$$P(A \cup B \cup C) = P(A) + P(B) + P(C) - P(A \cap B)$$
$$-P(B \cap C) - P(C \cap A) + P(A \cap B \cap C) \quad (1)$$

Solution: Consider

$$E = B \cup C \quad (2)$$

$$P(A \cup B \cup C) = P(A \cup E) = P(A) + P(E) - P(A \cap E) \quad (3)$$

$$P(E) = P(B \cup C) = P(B) + P(C) - P(B \cap C) \quad (4)$$

$$A \cap E = A \cap (B \cup C) = (A \cap B) \cup (A \cap C) \quad (5)$$

$$P(A \cap E) = P[(A \cap B) \cup (A \cap C)] = P(A \cap B) \quad (6)$$
$$+ P(A \cap C) - P[(A \cap B) \cap (A \cap C)]$$

$$P(A \cap E) = P(A \cap B) + P(A \cap C) - P(A \cap B \cap C) \quad (7)$$

using equation(3) and equation(4) and equation(7)

$$P(A \cup B \cup C) = P(A) + P(B) + P(C) - P(A \cap B) \quad (8)$$
$$- P(B \cap C) - P(C \cap A) + P(A \cap B \cap C)$$

Fig. 2. By this figure generated by python code,we can verify equation (8) intutively
